

I have filed comments last year on 03-104 and I feel now as I did then: there has been insufficient informing of the public as to the extent of interference by BPL to licensed users, and by licensed users to BPL. With deployment increasing in a number of communities, the interested parties will very shortly realize the extent of the problem.

Let FCC stick to its promise to discontinue immediately BPL deployment when/if it becomes apparent that significant interference is occurring.

The sooner we find out about BPL both as a source and a highly susceptible receiver of interference, the sooner investors can make intelligent decisions about where to put their money.

In the worst case, if an airliner crashes because of the interference to Airinc frequencies, or if loss of life occurs when emergency personnel can't respond properly in a locality, we will realize the terrible mistake that it is to ignore scientific and engineering data which overwhelmingly convict BPL as an awful idea.

Respectfully,
